Kentang Varietas Kastanum *Kastanum Potato Variety*

Inventor : Kusmana, E. Sofiari, I. Sulastrimi, A. Hasyim, H. Kurniawan, M. Pakih, dan N. Rachmawati

Balai Penelitian Tanaman Sayuran
Indonesian Vegetables Research Institute

Kentang unggul varietas Kastanum dihasilkan dari persilangan antara tetua 393077.54 (M) x 391011.17 (F). Varietas unggul ini mampu menghasilkan 34 ton per hektar. Kentang selain dapat digunakan sebagai sayur juga dapat diolah menjadi keripik. Varietas Kastanum memiliki kulit umbi kuning, daging umbi kuning, dan bentuk umbi oval.

Pengembangan kentang unggul varietas Kastanum diharapkan dapat berkontribusi terhadap peningkatan produksi di berbagai daerah, antara lain di Provinsi Aceh, Sumatera Utara, Sumatera Barat, Jambi, Jawa Barat, Jawa Tengah, Jawa Timur, Sulawesi Selatan, Sulawesi Utara, dan Nusa Tenggara Barat.

The Kastanum was selected from a crossing between parental 393077.54 (M) x 391011.17 (F) lines. Its yield potential is 34 tons per hectare. In addition to use as a vegetable, Kastanum can also be processed into chips. Its tuber skin and flesh are yellow while the tuber shape is oval.

Similar to GM 05 and Andina, this variety is also expected to contribute to potato production increase in various provinces, such as Aceh, North Sumatra, West Sumatra, Jambi, West Java, Central Java, East Java, South Sulawesi, North Sulawesi, and West Nusa Tenggara.
